

Sprint 1 Retrospective

One major accomplishment of this sprint was understanding the structure of our project and how to work with the agile methodology. We agreed that this sprint had the least amount of progress compared to what we had planned for the next two sprints. This was done intentionally so that we could focus on creating a strong foundation to build features upon. We agreed that we did a good job of communicating our challenges and the structure of the project as it develops.

One thing that we could improve upon for the next sprint is **better teamwork**. We decided for this sprint to strictly separate the work so that Ben oversaw frontend development, Brian oversaw backend development, and Travis oversaw the database. We quickly realized that these areas differed greatly in size and that the database took less than an hour to create while the frontend took many hours. By the end of this sprint, we were working together on the sprint.

Another improvement for the next sprint will be **pushing to GitHub more frequently**. Although this sprint was starting from scratch, we could have pushed our code to the repository more to make sure that the code worked for other teammates. By pushing more frequently, we can have a failsafe for major bugs and allow for better teamwork.

Another improvement we will implement in the next sprint will be **documenting problems and bugs**. By doing this, we will be able to communicate our struggles during standup meetings and will make writing our future sprint reports easier.

We have achieved our goals for this sprint and will be able to implement the strategies listed above to improve our teamwork and organization in future sprints to enable better development.
